

CERTIFICATE PROGRAM · STUDY GUIDE

Generative AI for the Modern Workplace

A practical companion guide to Sessions 1–6, with real prompts and techniques for Word, Excel, PowerPoint, AI-generated images, and email.

Covers foundations, prompt engineering, code generation, image & multimodal AI, industry applications, and responsible evaluation — with a cross-tool quick-reference library.

Introduction to Generative AI

This session builds the foundation for everything that follows: what generative AI actually is, how it differs from the AI you may already know, and where it fits into your daily work. By the end of this section you should be able to explain generative AI to a colleague in plain language and recognize which everyday tasks it can help with.

What Is Generative AI?

Generative AI refers to systems that create new, original content — text, images, audio, video, or code — rather than simply analyzing existing data. It learns patterns from huge amounts of example content, then uses those patterns to produce something new in response to your instructions. No programming knowledge is required to use it: the instructions you give are written in plain, everyday language.

W WORD

SCENARIO

You need a one-paragraph company bio for a new proposal template and don't want to start from a blank page.

PROMPT TO USE

```
"Write a 3-sentence company bio for a mid-sized logistics company, professional tone, suitable for the opening of a client proposal."
```

→ Paste the result straight into Word, then adjust names, numbers, and specifics before sending.

Traditional AI vs. Generative AI

Traditional AI is built to analyze, classify, or predict from existing data — think spam filters or fraud detection scores. Generative AI is built to create something new. A simple test: if the task involves sorting or scoring things that already exist, that's traditional AI territory. If the task involves producing new words, images, or ideas, that's generative AI.

X EXCEL

SCENARIO

You already use an Excel formula to flag overdue invoices — that's traditional, rule-based logic. Now you want AI to explain it to a new team member.

PROMPT TO USE

```
"Explain what this formula does in plain English, for someone who has never used Excel formulas before:  
=IF(TODAY()-C2>30,"Overdue","OK")"
```

→ Use generative AI to explain or document existing rules — the rule itself can stay exactly as it is.

Evolution of Generative AI Models

Generative AI has evolved through several stages: rule-based systems, then classic machine learning, then deep learning and transformers (the architecture behind large language models like GPT and Claude), and separately, diffusion models, which generate images by starting with random visual noise and gradually refining it into a picture that matches your description. Understanding this helps you know which type of model to reach for — text models for writing, diffusion models for images.

Major Application Domains

Generative AI spans six broad domains: text, code, image, audio, video, and multimodal (systems that combine several of these at once). Recognizing which domain a task falls into helps you choose the right tool — a text-focused assistant will not generate a usable image, and a pure image generator will not draft your email.

P POWERPOINT

SCENARIO

You need a rough outline for a 6-slide internal update before you start building the deck.

PROMPT TO USE

“Create a 6-slide outline for an internal project status update: one title slide, one summary, three progress sections, one next-steps slide. Just headings and 2 bullet points per slide.”

→ Use the outline as your slide skeleton, then fill in the specifics only you know.

Benefits, Limitations & Ethical Considerations

Generative AI offers real benefits — speed, accessibility, and a strong starting point for almost any task. But it also hallucinates (states incorrect information confidently), can reflect bias from its training data, and raises real ethical questions around misinformation, copyright, and job impact. Treat every output as a capable first draft, not a finished, verified answer.

@ EMAIL

SCENARIO

AI drafts a client-facing email referencing a discount percentage you never confirmed.

PROMPT TO USE

“Draft a renewal email for our client, mentioning a loyalty discount — then review it and flag any numbers, dates, or claims I need to verify before sending.”

→ Asking the AI to flag its own assumptions is a simple habit that catches many hallucinations before they reach a client.

Popular GenAI Platforms

The major platforms each have strengths: ChatGPT (OpenAI) is a versatile all-rounder; Claude (Anthropic) is strong on nuanced writing and long documents; Gemini (Google) is tightly integrated with Google Workspace; Copilot (Microsoft) is built into Word, Excel, and Outlook; and DALL·E (OpenAI) specializes in image generation. Most organizations settle on one or two based on which productivity suite they already use.

D DRAWING

SCENARIO

You want a simple, on-brand icon for an internal newsletter section header.

PROMPT TO USE

“A simple, flat-style icon of a lightbulb inside a circle, two-tone blue and white, minimal, suitable for a newsletter header.”

→ Keep icon prompts simple — flat, minimal styles generate more reliably than complex, detailed scenes.

AI for Text Generation

This session is where prompting becomes a genuine workplace skill. You will learn a repeatable framework for writing effective prompts, and apply it to the four things most professionals do every day: drafting, summarizing, translating, and writing business emails and documents.

Prompt Engineering Fundamentals

Prompt engineering is simply the skill of giving AI clear, well-structured instructions — the same skill as briefing a new colleague well. It is not coding, and it is not guesswork: small, deliberate changes in wording reliably change the quality of the output.

Writing Effective Prompts: the R-T-C-F Method

A reliable structure for any prompt: Role (who should the AI act as), Task (what exactly you want), Context (audience, purpose, tone, constraints), and Format (bullets, table, word count, email). Stacking all four elements turns a vague request into a usable first draft almost every time.

W WORD

SCENARIO

You need a one-page project proposal outline for internal stakeholders.

PROMPT TO USE

`"Act as a project coordinator. Write a one-page project proposal outline covering objective, scope, timeline, and budget, for a non-technical internal audience. Format as headed sections with 2-3 bullets each."`

→ Save your favorite R-T-C-F prompts as Word Quick Parts or a shared prompt library so your team reuses what works.

Text Generation Techniques

Effective techniques include brainstorming multiple options before committing to one, drafting fast then refining in follow-up messages, explicitly setting the tone, and asking for structure (headers, outlines) rather than one long block of text.

P POWERPOINT

SCENARIO

You want several headline options for a new internal training program before choosing one.

PROMPT TO USE

"Give me 8 name options for our new onboarding training program, ranging from formal to playful, each under 5 words."

→ Asking for a range — formal to playful — in one request saves you from running the prompt multiple times.

Summarization of Articles and Reports

When summarizing, always specify the audience, the desired length, and what to focus on (numbers, risks, decisions). The same source document produces very different, equally valid summaries depending on who will read them.

W WORD

SCENARIO

A 12-page vendor report needs to become a half-page brief for your director.

PROMPT TO USE

"Summarize the attached vendor report in 5 bullet points for a director with no time to read the full document. Highlight cost, risk, and the recommended decision. Keep it under 120 words."

→ Ask for action items separately: "Also list any decisions I need to make."

Translation and Paraphrasing

For translation, always specify formality and audience — without it, results can sound stiff or too casual. Paraphrasing is different: it keeps the same language but simplifies jargon or adjusts tone, ideal for making dense policy text accessible to new employees.

@ EMAIL

SCENARIO

A client email needs to go out in formal Spanish, and your own Spanish is conversational at best.

PROMPT TO USE

"Translate this client email into formal Spanish, keeping a professional and respectful tone: [paste email]."

→ Always have a fluent speaker do a final check on any client-facing translation before sending.

Email and Business Document Generation

The strongest prompts for business writing specify purpose, recipient, key points, and tone. AI can draft in seconds what used to take twenty minutes — meeting recaps, follow-ups, proposals, and even difficult messages that need a careful, measured tone.

@ EMAIL

SCENARIO

You need to follow up after a client call where they raised a pricing concern.

PROMPT TO USE

"Write a friendly follow-up email after our client call, referencing their concern about pricing and proposing a 15-minute call next week to discuss options. Keep it under 100 words."

→ Always personalize names, dates, and specific details — AI cannot know what was actually said on your call.

Comparing Outputs from Different AI Tools

No single tool is best at everything. For anything high-stakes — a big client email, an important report — run the same prompt through two tools and compare tone, accuracy, and usability before choosing which to send.

W WORD

SCENARIO

An important client proposal needs the best possible first draft.

PROMPT TO USE

“(Run the identical proposal prompt in two different AI tools, then compare which draft needs the least editing.)”

→ *Keep a simple personal record of which tool tends to perform best for which type of document — patterns emerge quickly.*

Code Generation and AI-Assisted Development

You do not need to be a programmer to benefit from AI coding assistants. This session focuses on the practical side: automating repetitive spreadsheet tasks, understanding error messages, documenting inherited files, and using AI responsibly when your work touches real data.

Introduction to AI Coding Assistants

AI coding assistants like Copilot, ChatGPT, and Claude read, write, and explain code from plain-English instructions. For non-programmers, the real value is automating spreadsheet work, understanding what your technical colleagues are doing, and prototyping an idea before handing it to IT.

Code Generation Using Natural Language Prompts

The strongest prompts name the tool (Excel, Google Sheets, etc.), describe the input data, and describe the desired output. Ask for a plain-English explanation alongside the code so you understand — and can verify — what it does.

X EXCEL

SCENARIO

You manually check a spreadsheet every week for overdue items and want it automated.

PROMPT TO USE

`"Write a Google Sheets script that checks column C. If the value is 'Overdue', send me an email with the row's details. Also explain in plain English what the script does and where to paste it."`

→ Always ask "where do I paste this?" if you're not sure — it removes the most common blocker for non-technical users.

Debugging and Error Explanation

When something breaks, paste the exact error message — not a paraphrase — and ask for a plain-English explanation and fix. Adding what you were doing when it happened improves accuracy further.

X EXCEL

SCENARIO

A formula suddenly shows #REF! and you don't know why.

PROMPT TO USE

"Explain this Excel error in plain language and tell me how to fix it: #REF! error in cell D12."

→ #REF! usually means a formula is pointing to a row or column that was deleted — check recent edits first.

Code Documentation and Commenting

AI can explain what an inherited macro or script does, line by line, and add comments so the next person — including future you — understands it without reverse-engineering the logic from scratch.

W WORD

SCENARIO

You inherited a spreadsheet macro from a departed colleague with no documentation.

PROMPT TO USE

"Add comments to this macro explaining what each line does, written for someone who has never coded before, then summarize it in one paragraph I can paste into our process documentation."

→ Paste the plain-English summary into your team's Word-based process manual so the knowledge doesn't leave with the next person.

Code Optimization Suggestions

Once something works, a simple follow-up question often reveals ways to make it faster, more reliable, or easier to maintain — for example, processing data in batches instead of one row at a time.

X EXCEL

SCENARIO

A script takes 5 minutes to process 10,000 rows and slows down your whole morning.

PROMPT TO USE

`"This script takes 5 minutes to run on 10,000 rows – can you suggest ways to make it faster, and explain what could break if the data format changes?"`

→ Asking *"what could break this"* is as valuable as asking for speed — it surfaces fragility before it causes a real problem.

Benefits, Risks, and Limitations

The benefit is accessibility: automation without waiting on IT. The risk is that AI-generated code can look correct while containing subtle errors, security gaps, or missing business context — it always needs testing before real use.

Responsible Use in Software Development

Test on sample data first, never paste confidential data into public AI tools, get technical review for anything touching sensitive systems, and document what you deploy so the next person understands it too.

@ EMAIL

SCENARIO

Your overdue-invoice automation is ready to test, but it will eventually email real customer data.

PROMPT TO USE

"Before I connect this script to real customer data, list every point where it touches personal or financial information, so I know what to review with IT first."

→ Run any data-touching automation on a small, non-critical sample before it ever reaches a real customer inbox.

Image Generation and Multimodal AI

This session covers creating and editing images with AI, understanding multimodal systems that combine text, image, and audio, and using AI to interpret existing images — all with a clear-eyed view of the copyright, bias, and misinformation risks involved.

Fundamentals of Text-to-Image Generation

Text-to-image models start from random visual noise and gradually refine it over many steps until it matches your description — no drawing skill required, just clear, specific words.

Prompt Design for Image Creation

A reliable framework: Subject (what/who), Style (photorealistic, watercolor, flat illustration), Setting (background/environment), and Mood/Lighting (warm, dramatic, bright). Add a Format note for aspect ratio and composition.

D DRAWING

SCENARIO

You need a banner image for a product launch email.

PROMPT TO USE

`"A sleek reusable water bottle on a wooden table, soft morning light, pastel green background, photorealistic style, 16:9 landscape format, space on the left for a logo."`

→ Iterate one change at a time — "make the background lighter" — rather than rewriting the whole prompt from scratch.

Image Editing and Style Modification

Beyond generating new images, AI can modify existing ones: swapping backgrounds, transferring styles, removing objects (inpainting), and upscaling low-resolution photos — all without design software.

P POWERPOINT

SCENARIO

A product photo has a cluttered background that doesn't match your slide deck's branding.

PROMPT TO USE

“Remove the background from this product photo and replace it with a soft blue-to-white gradient matching our brand colors, suitable for a PowerPoint title slide.”

→ Give exact brand hex codes in the prompt for consistent, on-brand results across multiple slides.

Introduction to Multimodal AI

Multimodal AI understands and combines more than one input type — text, images, and audio — in a single conversation, the way a person naturally does: you can show it something, talk to it, and get a written answer back.

Image Interpretation Using AI

AI vision models can “read” an image: extracting printed text, describing scenes, and analyzing charts — useful for accessibility, data entry, and quality checks without manual typing.

W WORD

SCENARIO

You photographed a whiteboard full of meeting notes and need them typed up.

PROMPT TO USE

“Extract the text from this whiteboard photo and organize it as a typed action list with owner and deadline columns, ready to paste into a Word document.”

→ Always double-check names and numbers extracted from handwriting — this is the most common source of small errors.

Ethical Issues: Copyright, Bias, and Misinformation

Ownership of AI-generated images is legally unsettled and varies by tool and country. Training data can also reflect real-world bias, producing stereotypical results unless prompted more intentionally. And because AI images can look convincingly real, they carry a genuine misinformation risk if published without care.

@ EMAIL

SCENARIO

You want to include an AI-generated graphic in a company-wide newsletter.

PROMPT TO USE

“(Before sending) Check: does this tool's license allow commercial use? Does the image avoid depicting any real person? Would a reader mistake this for a real photograph?”

→ Label AI-generated images in external communications when appropriate — it takes one sentence and protects your organization's credibility.

Generative AI Across Industries

This session surveys how generative AI is already being used across customer service, marketing, HR, healthcare, education, legal, and business operations — with an emphasis on the governance practices that keep adoption safe and sustainable.

AI in Customer Service

Chatbots handle common questions 24/7, sentiment detection flags frustrated customers for faster escalation, and AI can summarize long support threads so agents start with the full picture instead of scrolling.

@ EMAIL

SCENARIO

A 20-message support thread about a delayed shipment needs a fast, accurate summary.

PROMPT TO USE

`"Summarize this 20-message support chat, note whether the issue was resolved, and suggest one follow-up action."`

→ Ask for a resolution status explicitly — "resolved / not resolved" — so agents can triage at a glance.

AI in Marketing and Content Creation

AI accelerates the content cycle: drafting social posts and ad copy, generating variants for A/B testing, personalizing messaging by audience segment, and repurposing one asset into several formats.

P POWERPOINT

SCENARIO

A quarterly marketing review deck needs a strong opening slide summarizing campaign results.

PROMPT TO USE

`"Draft 3 headline options and one summary paragraph for a marketing review slide covering a 20% increase in engagement this quarter, confident and concise tone."`

→ Generate multiple headline options every time — the first version is rarely the strongest.

AI in Human Resource Management

AI drafts job postings and interview questions, supports (never replaces) resume screening, and answers common onboarding questions — always with a human making the final call on people decisions.

W WORD

SCENARIO

A new Marketing Coordinator role needs a job description and interview questions drafted quickly.

PROMPT TO USE

`"Write a job description for a Marketing Coordinator role, then list 4 structured interview questions with a note on what a strong answer includes for each."`

→ Always run a bias check on job description language before posting — see Session 6 for the technique.

AI in Healthcare and Education

In healthcare, AI's safest role today is administrative: transcribing notes, drafting discharge summaries for clinician review, and answering general patient FAQs — never diagnosis. In education, AI generates practice quizzes, study guides, and lesson plan drafts, freeing teacher time for direct student support.

W WORD

SCENARIO

A teacher needs a quick practice quiz based on a textbook chapter.

PROMPT TO USE

`"Create a 10-question quiz based on this chapter, with an answer key, formatted for a one-page handout."`

→ For healthcare admin tasks, always have a qualified clinician review and sign off before anything reaches a patient record.

AI in Legal and Business Operations

AI can summarize a contract's key terms, draft first-pass routine documents, turn meeting recordings into structured minutes, and document informal workflows — always paired with qualified human review for anything binding.

X EXCEL

SCENARIO

A vendor contract's payment and renewal terms need to be tracked in your contracts spreadsheet.

PROMPT TO USE

"Summarize this vendor contract's payment terms, termination clause, and auto-renewal conditions as three short rows I can paste into my Excel contract tracker."

→ Always have qualified legal counsel verify any contract summary before acting on it — this saves review time, not review itself.

Case Studies of Industry Adoption

Across every sector, the consistent adoption pattern is the same: AI takes on repetitive, high-volume work — routine support chats, transaction monitoring, documentation — while people retain responsibility for judgment calls and exceptions.

Responsible AI Governance

Good governance rests on a few practical habits: clear usage policies, human review before anything goes external, protection of sensitive data, bias monitoring, and a named, accountable owner for every AI-assisted system in use.

@ EMAIL

SCENARIO

Before rolling out a new AI tool company-wide, your team needs a simple usage policy.

PROMPT TO USE

"Draft a short internal email to staff explaining what data may and may not be entered into our new AI tool, and who to contact with questions."

→ A one-paragraph policy that people actually read beats a ten-page policy that nobody opens.

Evaluating Generative AI Outputs

The final session ties everything together: how to critically evaluate any AI output before you rely on it. These habits — checking accuracy, catching hallucinations, spotting bias, and keeping a human in the loop — apply to every tool and task covered in this course.

Evaluating Accuracy, Relevance, and Completeness

Run every important AI answer through three quick lenses: Accuracy (are the facts correct?), Relevance (does it actually answer what was asked?), and Completeness (is anything missing?). It takes seconds and catches most problems.

X EXCEL

SCENARIO

AI summarizes last quarter's top sales regions from your spreadsheet data.

PROMPT TO USE

"Based on this data, what were our top 3 sales regions last quarter? Then I will independently check your answer against the pivot table before using it in my report."

→ Cross-check at least one specific figure against the source data every time — it takes a minute and builds a habit of verification.

Detecting Hallucinations and AI Errors

Watch for oddly specific numbers with no clear source, citations that don't check out, and contradictions within the same response. When in doubt, ask the AI to cite its source, then verify that source independently.

W WORD

SCENARIO

AI cites a statistic in a report draft that you can't recall seeing elsewhere.

PROMPT TO USE

"Can you give me the exact title, author, and publication link for the study behind that 34% figure?"

→ If the AI can't produce a real, checkable source, treat the figure as unverified and remove it before publishing.

Bias and Fairness Evaluation

Watch for stereotypical assumptions about age, gender, or background, and try the “swap test” — changing a name or detail in your prompt to see if the quality or tone of the response changes.

W WORD

SCENARIO

A generated job ad describes the ideal candidate as “young and energetic.”

PROMPT TO USE

“Rewrite this job ad to remove any age, gender, or exclusionary language, while keeping the same requirements.”

→ Run a bias check on any AI-drafted HR or recruiting document before it's published — not just once, but every time.

Human-in-the-Loop Validation

For high-stakes decisions — hiring, financial, medical, legal, or anything published externally — keep a person actively reviewing AI output, not just skimming it, with real authority to reject or heavily edit before it goes further.

@ EMAIL

SCENARIO

An AI-drafted email is about to go out to your entire client list.

PROMPT TO USE

“(Workflow, not a prompt): AI Draft → Fact-Check → Human Review → Final Approval. No mass email goes out without a named person completing step 3.”

→ Write the review step into your team's process, not just your personal habit — habits break under deadline pressure; processes hold.

Selecting Appropriate AI Tools for Different Tasks

Before starting, ask: does this need current information? Does it need citations? Is the data sensitive? What output format do I need? The answers point you toward the right tool — general chat, search-enabled, enterprise, or specialized.

P POWERPOINT

SCENARIO

You need current industry statistics for a board presentation, not general knowledge.

PROMPT TO USE

“(Tool-selection check, not a content prompt): Does this task need live, current data? If yes, use a tool with web search and citations, not a general chat assistant alone.”

→ For anything time-sensitive, confirm your tool can search the live web before you trust its numbers.

Best Practices for Responsible AI Usage

Verify before you rely, disclose AI use per your organization's policy, protect sensitive data, keep a human accountable, and document which tools and prompts you used — useful for both review and your own learning over time.

Practical Assessment and Lab Report Guidance

A strong practical report shows your prompts (not just the polished result), clearly marks what's AI-generated versus your own edits, includes your evaluation of accuracy and bias, and reflects honestly on the AI's limitations in that task.

W WORD

SCENARIO

You are compiling your final practical report for this certificate program.

PROMPT TO USE

“(Report structure): Objective → Tools & Prompts Used → AI Output Summary → Your Evaluation → Edits & Corrections Made → Conclusion & Limitations.”

→ Draft your report entry immediately after each exercise, while the details are fresh — don't try to reconstruct it later.

Quick-Reference Prompt Library

Ready-to-use prompt templates, organized by tool. Replace anything in [brackets] with your specifics.

Word — Documents & Reports	
Draft a report section	Act as a [role]. Write a [length] section on [topic] for [audience], in a [tone] tone, formatted with headers and bullet points.
Summarize a long document	Summarize the attached document in [X] bullet points for [audience]. Focus on [numbers / risks / decisions]. Keep it under [X] words.
Simplify dense text	Rewrite this paragraph in plain language for someone with no background in [topic], keeping the same meaning.
Proofread without rewriting	Proofread the text below for grammar and tone only. Do not change the content or structure. "" [paste text] ""
Add documentation	Add comments or a plain-English summary explaining what this document/process does, for someone new to the team.

Excel — Spreadsheets & Automation	
Explain a formula	Explain what this formula does in plain English, for someone who has never used Excel formulas before: [paste formula].
Generate a script or formula	Write a [Excel / Google Sheets] [formula / script] that [task]. Input: [describe data]. Output: [describe result]. Also explain what it does.
Diagnose an error	Explain this error in plain language and how to fix it: [paste exact error message].
Optimize performance	This takes [X time] to run on [X rows] – suggest ways to make it faster, and note what could break if the data changes.
Summarize data for a report	Based on this data, summarize the top 3 trends in plain language, suitable for a one-paragraph executive summary.

PowerPoint — Slides & Presentations	
Build a slide outline	Create a [X]-slide outline for [purpose]: [list slide types]. Just headings and 2-3 bullet points per slide.
Generate headline options	Give me [X] headline or title options for a slide about [topic], ranging from formal to attention-grabbing.
Tighten slide text	Rewrite this slide text to be more concise – no more than [X] words, keeping the key message.
Draft speaker notes	Write brief speaker notes for this slide, expanding on the bullet points in a conversational tone, under 60 seconds when spoken aloud.
Request a supporting graphic	A [style] image of [subject], [setting], [mood/lighting], [aspect ratio] format, suitable for a presentation title slide.

Drawing — AI-Generated Images

Structure an image prompt	Subject: [what/who]. Style: [photorealistic / illustration / watercolor]. Setting: [background]. Mood: [lighting/tone]. Format: [aspect ratio].
Refine a first result	Keep the same composition, but make the [background / lighting / color palette] more [description].
Swap or clean a background	Remove the background from this image and replace it with [description or brand color], keeping the main subject unchanged.
Interpret an existing image	Extract the [text / data / key details] from this image and organize it as [a list / a table / plain text].
Run an ethics check	Before I use this: does it depict any real person? Could it be mistaken for a real photo? What are this tool's commercial-use terms?

Email — Business Correspondence

Draft a follow-up	Write a [tone] follow-up email to [recipient] about [topic], referencing [specific detail], under [X] words.
Handle a difficult message	Help me write a polite but firm email [declining / following up on / addressing] [situation], professional and respectful in tone.
Translate for a client	Translate this email into [formal/informal] [language], keeping a professional and respectful tone: [paste email].
Summarize a thread	Summarize this email thread, note whether the issue was resolved, and suggest one follow-up action.
Draft an internal policy note	Draft a short internal email explaining [policy/change], including what to do and who to contact with questions.
